这是我个人挑战自学「*Measure, Integration & Real Analysis, by Sheldon Axler*」的学习笔记，包括课文补注和部分习题。

我先从 *Supplement* 即第 0 章开始。我当时并没有学过数学分析，以为学完 Axler 的这个 Supplement 就能具备所有必要的知识基础。

0.B 节是我碰到的第一个挫折。本来课文非常温顺，但习题做起来却让我感到知识的桀骜不驯。

的确，它们不需要硬性知识门槛，可以用初中学过的不等式和高中学过的集合与量词来推导 \mathcal{D} 的一切。如你所见，字越少，事越大。

0.B Note: C, D are Dedekind cuts. Numbers used here are always rational.

- Define $\tilde{q} = \{a : a < q\}$, and $-\tilde{q} = \tilde{-q} = \{a : a < -q\}$.
Then $\tilde{0} = \{a : a < 0\} = \mathbf{Q} \setminus \mathbf{Q}^*$ $\Rightarrow -\tilde{0} = \{a : a < -b \leq 0\} = \tilde{0}$.
- Define $-D = \{a : a < -b, b \notin D\} = \{-a : -a < -b \Leftrightarrow a > b, b \notin D\}$.
 $-(-D) = -\{a : a < -b, b \notin D\} = \{c : c < -a, a \geq -b, \forall b \notin D\} = \{c : c < b, \forall b \notin D\} = D$.
The last equa is becs (a) $d \notin D \Rightarrow \exists b \notin D, d \geq b$, and (b) $d \in D \Rightarrow$ if $\exists b \notin D$ suth $d \geq b$, then $b \in D$, ctradic.

- TIPS: Prove $\forall \varepsilon > 0, \exists b \notin D$ suth $b - \varepsilon \in D$.

SOLUS: Asum $\exists \varepsilon > 0$ suth $\nexists b \notin D, b - \varepsilon \in D \Leftrightarrow \forall b \notin D, b - \varepsilon \notin D$.

Then $(b - \varepsilon) - \dots - \varepsilon = b - n \cdot \varepsilon \notin D$ for any $n \in \mathbf{N}^+$.

Now $\forall d \in D, \exists n \in \mathbf{N}^+$ suth $b - n \cdot \varepsilon < d \Rightarrow b - n \cdot \varepsilon \in D$, ctradic. \square

1 Prove (a) $D + \tilde{0} = D$, (b) $-D$ is Dedekind cut, and $D + (-D) = \tilde{0}$.

SOLUS: (a) $\forall d \in D, \exists \varepsilon > 0, d + \varepsilon \in D \Rightarrow (d + \varepsilon) + (-\varepsilon) \in D + \tilde{0}$.

(b) Asum $x \in -D$ is the largest elem of $-D \Rightarrow \exists b \notin D, x < -b \Rightarrow 0 < -b - x$.

Let $\delta = (-b - x)/2 \Rightarrow 0 < \delta < -b - x \Rightarrow x < x + \delta < -b$.

Thus by def, $x + \delta \in -D$, ctradic the max of $x \in -D$. Hence $-D$ is Ddkd cut.

$D + (-D) = \{x + y : x + y < x - b, x \in D, b \notin D\}$.

Supp $a \in \tilde{0} \Rightarrow -a > 0$. By TIPS, $\exists b \notin D$ suth $b + a \in D$.

Note that $b < b - a \notin D \Rightarrow -b > -b + a \in -D$. Then $(-b + a) + (b + a) = 2a < 0$.

Thus $\forall a \in \tilde{0}, \exists b \notin D, d = b + \frac{1}{2}a \in D, c = -b + \frac{1}{2}a \in -D \Rightarrow c + d = a \in D + (-D)$. \square

3 Show $C \subsetneq D \Leftrightarrow D - C = \{d - y : d \in D, y > x, x \notin C\}$ posi.

SOLUS: (a) $C \subsetneq D \Rightarrow \exists x \in D \setminus C \Rightarrow \exists y \in D, y > x \Rightarrow \exists d \in D, d > y \Leftrightarrow 0 < d - y \in D - C$.

(b) $0 \in D - C \Rightarrow \exists y > x \notin C, y \in D \Rightarrow \forall c \in C, c < x < y \in D \Rightarrow C \subseteq D$. 又 $D - C \neq \tilde{0}$. \square

5 Prove (a) D posi $\Rightarrow -D$ not posi, (b) non0 $-D$ not posi $\Rightarrow D$ posi.

SOLUS: (a) $0 \notin \{a : a < -b, b \notin D\} \Leftrightarrow \nexists b \notin D, 0 < -b \Leftrightarrow \forall b \notin D, b \geq 0 \Leftrightarrow 0 \in D$.

(b) Becs $\tilde{0}$ is the largest non posi cuts. Thus $-D \neq \tilde{0} \Rightarrow -D \subsetneq \tilde{0} \Rightarrow \tilde{0} - (-D) = D$ posi.

Or. $\exists a < 0, a \notin -D = \{a : -a > b, b \notin D\} \Leftrightarrow \nexists b \notin D, -a > b \Leftrightarrow \forall b \notin D, 0 < -a \leq b$. \square

- Define $D^+ = \{d \in D : d > 0\} = D \cap \mathbf{Q}^+$. Then $D^+ \neq \emptyset \Leftrightarrow \mathbf{Q} \setminus \mathbf{Q}^+ \subsetneq D \Leftrightarrow 0 \in D \Leftrightarrow D$ posi.

Define $D^- = \{r \notin D : r \leq 0\} = (\mathbf{Q} \setminus D) \cap (\mathbf{Q} \setminus \mathbf{Q}^+) = \mathbf{Q} \setminus (D \cup \mathbf{Q}^+)$.

(a) $D^- = \{0\} \Leftrightarrow D = \tilde{0}$. Convly, $\{r \notin D : r \leq 0\} = \{0\} \Rightarrow \mathbf{Q} \setminus D = \mathbf{Q}^*$.

(b) $D^- = \emptyset \Leftrightarrow D \cup \mathbf{Q}^+ = \mathbf{Q} \Leftrightarrow \mathbf{Q} \setminus \mathbf{Q}^+ \subseteq D \Leftrightarrow 0 \in D \Leftrightarrow D$ posi. CORO: D not posi $\Leftrightarrow 0 \in D^-$.

(c) $(D^-)^- = \{r \in D : r \leq 0\} = \mathbf{Q} \setminus D^+$. CORO: D not posi $\Leftrightarrow (D^-)^- = D$.

- $(-D)^+ = (-D) \cap \mathbf{Q}^+ = \{a : 0 < a < -b, b \notin D \Leftrightarrow b \in D^- \setminus \{0\}\}$.

$(-D)^- = (\mathbf{Q} \setminus -D) \cap (\mathbf{Q} \setminus \mathbf{Q}^+) = \{a : 0 \geq a \geq -b, \forall b \notin D\}$.

- For C, D posi, define $CD = \{a : a \leq cd, c \in C^+, d \in D^+\} = \{cd : c \in C^+, d \in D^+\} \cup (\mathbf{Q} \setminus \mathbf{Q}^+)$.

$\{cd : c \in C^+, d \in D^+\} = CD \cap \mathbf{Q}^+ = (CD)^+$. Note that ' $a \leq cd$ ' here is equiv to ' $a < cd$ '.

- For $-C, -D$ posi, define $CD = (-C)(-D) = \{cd : c \in (-C)^+, d \in (-D)^+\} \cup (\mathbf{Q} \setminus \mathbf{Q}^+)\$.
 $CD = \{0 < cd < (-r)(-s) : r \in C^- \setminus \{0\}, s \in D^- \setminus \{0\}\} \cup (\mathbf{Q} \setminus \mathbf{Q}^+) = \{a : a < rs, r \in C^-, s \in D^-\}$.
If $C, -C$ not posi $\Rightarrow C = \tilde{0}$, then with the asum $\tilde{0}D = \tilde{0}$, it still holds. Simlr for D .

- For D posi, define $D^{-1} = \{a : a < 1/b, b \notin D\} \Rightarrow DD^{-1} = \{a : a \leq d/b < 1, b \notin D, d \in D^+\} = \tilde{1}$.
The last equa holds becs $\forall a \in \tilde{1} \cap \mathbf{Q}^+$, $\exists d \in D^+$ suth $b = d/a \notin D \Rightarrow d/b = a \in DD^{-1}$.
- For non0 D not posi, define $D^{-1} = -(-D)^{-1} = -\{a : a < 1/b, \exists b \notin -D \Leftrightarrow \exists b \geq -s, \forall s \notin D\}$
 $= \{a : a < -x, \exists x \geq 1/b, \forall b$ suth $b \geq -s, \forall s \notin D\} = $\{a : a < -1/b, \forall b$ suth $b \geq -s, \forall s \notin D\}$
 $= \{a : a < 1/b, \forall b$ suth $b \leq s, \forall s \notin D\} \neq $\{a : a < 1/s, \forall s \notin D\}$.
Let $b_1 < \dots < b_m < \dots \leq s, \forall s \notin D \Leftrightarrow \forall s \in D^- \Rightarrow$ each $s_j, b_k < 0 \Rightarrow 1/s_j \leq \dots < 1/b_m < \dots < 1/b_1$.
Thus ' $a < 1/b'$ is equiv to ' $a < 1/s, \exists s \in D^-$ '. Hence $D^{-1} = \{a : a < 1/b, b \in D^-\}$.
 $DD^{-1} = \{a : a < rs, \exists r \in D^-, \exists s$ suth $0 \geq s \geq 1/b, \forall b \in D^-\} \subseteq \tilde{1}$.
Asum $\exists x$ suth $rs \leq x < 1, \forall r, s$. Let $D \not\ni \dots \leq b_m < \dots < b_1 \leq 0$, and $D \not\ni \dots \leq r_m < \dots < r_1 \leq 0$.
 $1/b_1 < \dots < 1/b_m \leq \dots \leq s_n < \dots < s_1 \leq 0$, and $r_m/b_m \geq \dots \geq r_m s_n > \dots > r_j s_k > \dots > r_1 s_1$.
Let $r_m = b_m$. Ctradic. Or. $DD^{-1} = D[(-\tilde{1})(-D)^{-1}] = [D(-\tilde{1})](-D)^{-1} = (-D)(-D)^{-1} = \tilde{1}$.$$

- For C not posi and D posi, we expect that CD not posi. Consider C and $-D$ both not posi.
 $CD = -[C(-D)] = -\{a : a < rt, r \in C^-, t \in (-D)^-\} = \{-a : a > b, b \geq rt, \forall r \in C^-, t \in (-D)^-\}$
 $= \{-a : a > rt, \forall r \in C^-, \forall t$ suth $0 \geq t \geq -s, \forall s \notin D\}$
 $= \{a : a < ru, \forall r \in C^-, \forall u$ suth $0 \leq u \leq s, \forall s \notin D\}$. ($r \leq 0 < s, rs \leq ru = -rt \leq 0 \leq rt \leq -rs$.)
- Note the ' $0 \leq u$ '. Becs $C^- \neq \emptyset \Rightarrow 0 \in C^-$. If it is to be exactly $CD = \{a : a < 0\}$, then $C^- = \{0\}$,
for if not, $\exists u > 0$, and $\exists r \in C^- \setminus \{0\}$, suth $\exists a < ru < 0$. Hence ' $0 \leq u$ ' is actually ' $0 < u$ '.
- ' $u \leq s'$ cannot be abbreviated as in $\{-a : a > -rs, \forall s \notin D, r \in C^-\} = \{a : a < rs, \forall s \notin D, r \in C^-\}$.
' $u \leq s'$ cannot be ' $u < s'$ ', becs here $rs < ru \Rightarrow \exists a = rs$.
- Note that $\{u : 0 < u \leq s, \forall s \notin D\} = \begin{cases} D^+ \cup \{\min \mathbf{Q} \setminus D\}, & \text{if it exists,} \\ D^+, & \text{othws.} \end{cases}$ Denote it by $D^\oplus = D^\otimes \setminus \{0\}$.

- For C not posi and D posi. If $C = \tilde{0}$, then $CD = -[C(-D)] = -\tilde{0}$. Now consider $-C$ and D both posi.
But $CD = -(-C)D = -\{a : a \leq cd, c \in (-C)^+, d \in D^+\} \neq \{a : a < -cd, \forall c \in (-C)^+, d \in D^+\}$.
Altho " $a \leq cd$ " is equiv to " $a < cd$ " so that $b \notin (-C)D \Rightarrow b \geq cd$, which is actually $b > cd, \forall c, d$.
And $a < -b < -cd, \forall c, d \Rightarrow \forall a, \exists x$ suth $a < x < -cd, \forall c, d$. While a can be the 'boundary' in RHS.
- $LHS = \{a : a < ru, \forall r \in C^-, \forall u \in D^\oplus\}, \{cs : c \in C, s \notin D\} = RHS$.
Becs $cs \leq cu < ru$. We show $LHS \subseteq RHS$. Let $c_1 < \dots < c_n < \dots \in C$, and $s_1 > \dots > s_m \geq \dots \notin D$.
Then $c_1 s_1 < \dots < c_n s_m < \dots < ru, \forall r, u$ as in LHS. Thus $a \in LHS \Rightarrow \exists a < c_j s_k$. \square
Or. Note that in LHS, ' $a < ru$ ' is equiv to ' $a < rs, \exists s \notin D$ '. Now $LHS = \{a : a/s \in C, \exists s \notin D\}$. \square

- For C posi and D not posi. If $D = \tilde{0}$, then $CD = -[(-C)D] = -\tilde{0}$.
 $CD = (-C)(-D) = \{a : a < ru, \forall r \in (-C)^-, \forall u \in (-D)^\oplus\} \quad \mathbf{Q} \setminus -D = \{s : s \geq -y, \forall y \notin D\}$
 $= \{a : a < ru, \forall r$ suth $\forall x \notin C, 0 \geq r \geq -x, \forall u$ suth $0 < u \leq s, \forall s \geq -y, \forall y \notin D\}$
 $= \{a : a < (-r)(-u), \forall r$ suth $\forall x \notin C, 0 \leq -r \leq x, \forall u$ suth $y \leq -u < 0, \forall y \notin D\}$
 $= \{a : a < ru, \forall r$ suth $\forall x \notin C, 0 \leq r \leq x, \forall u \in D^-\} = \{a : a < ru, \forall r \in C^\oplus, \forall u \in D^-\}$, simlr.

- We show $-D = \{a : a < -b, b \notin D\} = (-\tilde{1})D$.

For D posi, $RHS = \{a : a < ru, \forall r \text{ suth } -1 \leq r \leq 0, \forall u \in D^\oplus\} = \{a : a < -u, \forall u \in D^\oplus\} \supseteq -D$.

$\text{Supp } x \text{ suth } -b \leq x < -u, \forall b \notin D, \forall u \text{ suth } -s \leq -u < 0, \forall s \notin D \Rightarrow -s \leq x < -u$. Let $-u = x$.

For D not posi, $RHS = \{a : a < rb, \exists r \text{ suth } -1 \leq r \leq 0, b \in D^-\} = \{a : a < -b, 0 \geq b \notin D\} = -D$.

- We show $\tilde{1}D = D$. For D not posi, immed. Othws, $\tilde{1}D = \{a : a \leq ij < j, 0 < i < 1, j \in D^+\} \subseteq D$.

Now $(\tilde{1}D)^+ \subseteq D^+$. 又 $\forall d \in D^+, \exists \varepsilon > 0, d + \varepsilon \in D^+ \Rightarrow d = (d + \varepsilon) \frac{d}{d + \varepsilon} \in (\tilde{1}D)^+$.

4 *Supp B, C, D non0 Dedekind cuts. Show $(BC)D = B(CD)$, $B(C + D) = BC + BD$.*

SOLUS: Becs the sup not in seq \Rightarrow infly many disti elem.

$\forall a_i, \exists a_j, a_i < a_j < \sqrt{2}$. For a_{n+k} , choose $a_i > a_{n+k}$. If $i \in \{1, \dots, n\}$, then choose $a_j > a_i$.

After at most n steps, we must have a_m with $m > n$. Thus $\forall a_{n+i}, \exists a_{n+j}, a_{n+i} < a_{n+j} < \sqrt{2}$. □

• Supp nonempty $A \subseteq \mathbf{R}$.

• **TIPS 1:** Define $-A = \{-a : a \in A\} \Rightarrow -(-A) = A$. Prove $\sup(-A) = -\inf A$.

SOLUS: $-b$ is an up-bound of $-A \Leftrightarrow \forall a \in A, -a \leq -b \Leftrightarrow a \geq b \Leftrightarrow b$ is a low-bound of A .

Thus $-b_M = \sup(-A) \Leftrightarrow -b_M \leq -b \Leftrightarrow b_M \geq b \Leftrightarrow b_M = \inf A$. □

• **TIPS 2:** Show if $x \in \mathbf{R}$, (a) $\sup A > x \Rightarrow \exists a \in A, a > x$, (b) $\inf A < x \Rightarrow \exists a \in A, a < x$.

SOLUS: (a) $\nexists a > x \Leftrightarrow \forall a \in A, a \leq x \Rightarrow \sup A \leq x$.

OR. By (b), $\inf(-A) = -\sup A < -x \Rightarrow \exists -a \in A, -a < -x$.

Simlr for (b). □

6 Suppose nonempty $A, B \subseteq \mathbf{R}$. Prove $\sup(A + B) = \sup A + \sup B$, and $\inf(A + B) = \inf A + \inf B$.

SOLUS: $\inf A + \inf B \leq a + b \leq \sup A + \sup B \Rightarrow \sup(A + B) \leq \sup A + \sup B$, $\inf A + \inf B \leq \inf(A + B)$.

$$\sup A + \sup B > \sup(A + B) \Leftrightarrow \sup A > \sup(A + B) - \sup B$$

$$\Leftrightarrow \exists a + \sup B > \sup(A + B) \Leftrightarrow \sup B > \sup(A + B) - a \Leftrightarrow \exists a + b > \sup(A + B). \text{ Ctradic.}$$

Simlr for $\inf(A + B) \in A + B$. Or. Apply to $-A - B$, becs $\sup(-A) = -\inf A$. \square

16 Suppose $\mathbf{R}_1, \mathbf{R}_2$ are complete ordered fields. Define φ_1, φ_2 as in [0.11].

Define $\psi : \mathbf{R}_1 \rightarrow \mathbf{R}_2$ by $\psi(a) = \sup\{\varphi_2(q) : q \in \mathbf{Q}, \varphi_1(q) \leq a\}$. Show

(a) $\psi : \mathbf{R}_1 \rightarrow \mathbf{R}_2$ is one-to-one. (b) $\psi(0) = 0, \psi(1) = 1$.

(c) $\psi(a + b) = \psi(a) + \psi(b)$. (d) $\psi(ab) = \psi(a)\psi(b)$.

SOLUS: (a) Define $\mathcal{R}_1(a) = \{q \in \mathbf{Q} : \varphi_1(q) \leq a\} \Rightarrow \sup_{\mathcal{R}_1(a)} \varphi_1 = a$. Let $\psi_1(a) = \sup_{\mathcal{R}_1(a)} \varphi_2 = \psi(a)$.

Define $\mathcal{R}_2(c) = \{q \in \mathbf{Q} : \varphi_2(q) \leq c\} \Rightarrow \sup_{\mathcal{R}_2(c)} \varphi_2 = c$.

Define $\psi_2(c) = \sup_{\mathcal{R}_2(c)} \varphi_1$. Then $\psi_2 : \mathbf{R}_2 \rightarrow \mathbf{R}_1$ well-defined.

Note that $\mathcal{R}_2(\psi_1(a)) = \{q \in \mathbf{Q} : \varphi_2(q) \leq \sup_{\mathcal{R}_1(a)} \varphi_2\} = \mathcal{R}_1(a)$.

Now $\psi_2(\psi_1(a)) = \sup_{\mathcal{R}_1(a)} \varphi_1 = a$. Rev the roles of $\mathbf{R}_1, \mathbf{R}_2$.

(b) Becs $\varphi_1(q) \leq \varphi_1(0) \Leftrightarrow q \leq 0 \Leftrightarrow \varphi_2(q) \leq \varphi_2(0)$. Simlr for $\psi(1) = 1$.

(c) $S = \{\varphi_2(t) : t \in \mathbf{Q}, \varphi_1(t) \leq a + b\} \supseteq \{\varphi_2(p + q) : p, q \in \mathbf{Q}, \varphi_1(p) \leq a, \varphi_1(q) \leq b\} = T$
 $\Rightarrow \sup S \geq \sup T$. Asum it is ' $>$ '. Now $\exists t \in \mathbf{Q}$ suth $\sup S \geq \varphi_2(t) > \sup T = \psi(a) + \psi(b)$.

Which means $\varphi_2(t) > \varphi_2(p + q), \forall p, q \in \mathbf{Q}$ suth $\varphi_1(p) \leq a$ and $\varphi_1(q) \leq b$.

Now $a + b \geq \varphi_1(t) > \varphi_1[(t + p + q)/2] > \varphi_1(p + q), \forall p, q$. Ctradic.

(d) We show it for (I) $a, b > 0$, (II) $a > 0 > b$.

$LHS = \sup\{\varphi_2(t) : t \in \mathbf{Q}, \varphi_1(t) \leq ab\}, \sup\{\psi(a)\varphi_2(q) : q \in \mathbf{Q}, \varphi_1(q) \leq b\} = RHS$.

(I) $RHS = \sup\{\varphi_2(p)\varphi_2(q) : p, q \in \mathbf{Q}, 0 < \varphi_1(p) \leq a, \varphi_1(q) \leq b \Rightarrow \varphi_1(pq) \leq ab\}$.

(II) $RHS = \sup\{\varphi_2(s)\varphi_2(q) : s, q \in \mathbf{Q}, \varphi_1(q) \leq b, \text{ and } s \geq p, \forall p \text{ suth } 0 < \varphi_1(p) \leq a\}$.

Note that $\varphi_1(s) \geq \varphi_1(p), \forall p \Rightarrow \varphi_1(s) \geq a$, for if not, $\exists p' \in \mathbf{Q}$ suth $\varphi_1(s) < \varphi_1(p') \leq a$.

So that $\varphi_1(sq) \leq a\varphi_1(q) \leq ab$.

Now $LHS \geq RHS$. Asum it is ' $>$ '. Then $\exists t \in \mathbf{Q}$ suth $LHS \geq \varphi_2(t) > RHS$.

Which means $\varphi_2(t) > \psi(a)\varphi_2(q), \forall q \in \mathbf{Q}$ suth $\varphi_1(q) \leq b$.

(I) $\Rightarrow \varphi_2(t) > \varphi_2(s)\varphi_2(q), \forall q \text{ and } \forall s \in \mathbf{Q} \text{ suth } 0 < \varphi_1(s) \leq a$.

(II) $\Rightarrow \varphi_2(t) > \varphi_2(s)\varphi_2(q), \forall q \text{ and } \forall s \in \mathbf{Q} \text{ suth } \varphi_2(s) \geq \varphi_2(p), \forall p \text{ suth } 0 < \varphi_1(p) \leq a$.

Thus $ab \geq \varphi_1(t) > \varphi_1[(t + sq)/2] > \varphi_1(sq), \forall s, q$. Ctradic. \square

ENDED

0.D

• Suppose nonempty A is closed and open subsets of \mathbf{R}^n . Prove $A = \mathbf{R}^n$.

SOLUS: Asum $A \neq \mathbf{R}^n$. Let $a \in A, b \in \mathbf{R}^n \setminus A$. Define $f(t) = (1-t)a + tb$.

If $f(t_1) = f(t_2) \Rightarrow (t_1 - t_2)(b - a) = 0 \Rightarrow t_1 = t_2$. Inje.

Let $\mathcal{A} = \{t \in [0, 1] : f(t) \in A\}$, and $\sup \mathcal{A} = t_M \in [0, 1]$. Let $c = f(t_M)$.

(I) If $c \in A \Rightarrow \exists \delta > 0, B(c, \delta) \subseteq A$. Let $t \neq t_M$ be suth $f(t) \in B(c, \delta) \Rightarrow \|(t - t_M)(b - a)\|_\infty < \delta$.

Let $\varepsilon = |t - t_M| > 0 \Rightarrow f(t_M + \varepsilon) \in B(c, \delta) \subseteq A \Rightarrow t_M \geq t_M + \varepsilon$, ctradic.

(II) If $c \in \mathbf{R}^n \setminus A$. Simlr. $\forall t' \in [t_M - \varepsilon, t_M], t' \notin \mathcal{A}$. Now $\forall t \in \mathcal{A}, t < t_M \Rightarrow t < t_M - \varepsilon$. \square

15 $\text{Supp } F$ is a closed subset of \mathbf{R} . Prove $S = \{a^2 : a \in F\}$ is closed.

SOLUS: $\text{Supp } S$ not closed $\Rightarrow \exists a_1^2, a_2^2, \dots \in S$ convg to L^2 suth $\pm L \notin F$. Let $\varepsilon_1 > \varepsilon_2 > \dots \in \mathbf{R}^+$.

Becs $\forall \varepsilon_p, \exists m \in \mathbf{N}^+, \forall k \geq m, \|a_k^2 - L^2\|_\infty = |a_k - L| \cdot |a_k + L| < \varepsilon_p$,

if $|a_k - L| < \varepsilon_p$, then let $b_p = a_k$, if $|a_k + L| < \varepsilon_p$, then let $c_p = a_k$.

Then we have at least one seq in F with $\lim \pm L \notin F \Rightarrow F$ not closed. \square

17 $\text{Supp } F \subseteq \mathbf{R}$, and $\forall n \in \mathbf{N}^+, F \cap [-n, n]$ is closed. Prove F is closed.

SOLUS: Becs $G = (\mathbf{R} \setminus F) \cup (-\infty, -n) \cup (n, \infty)$ is open for all $n \in \mathbf{N}^+$. Let $n > \sup\{|a| : a \in \mathbf{R} \setminus F\}$.

By [0.59], $G = (-\infty, -n) \cup (n, \infty) \cup I_1 \cup I_2 \cup \dots$ (disj) $\Rightarrow I_1 \cup I_2 \cup \dots = \mathbf{R} \setminus F$. \square

20 Prove $\forall b \in \mathbf{R}^n, \delta > 0, B = \{a \in \mathbf{R}^n : \|a - b\| \leq \delta\}$ is closed. See below [0.46].

SOLUS: Asum $\exists a_1, a_2, \dots \in B$ convg to L suth $\|L - b\| > \delta$. Then $\forall \varepsilon > 0, \exists m \in \mathbf{N}^+, \forall k \geq m,$

$\|a_k - L\| < \varepsilon \Rightarrow \delta < \|L - b\| \leq \|a_k - L\| + \|a_k - b\| < \delta + \varepsilon$. Now $0 < \|L - b\| - \delta < \varepsilon$. Ctradic. \square

21 $\text{Supp } X$ is an open subset of \mathbf{R} . Prove $\exists a_k, b_k \in \mathbf{R}$ suth $X = \bigcup_{k=1}^{\infty} [a_k, b_k]$.

SOLUS: Let $X = \bigcup_{k=1}^{\infty} (c_k, d_k)$, where each $d_k < c_{k+1}$. Let $I_k = (c_k, d_k)$.

Let $a_{1,k}, a_{2,k}, \dots$ be convg of $\lim c_k$. Simlr, let $b_{1,k}, b_{2,k}, \dots$ of $\lim d_k$. Let $E_{j,k} = [a_{j,k}, b_{j,k}]$.

Now $\bigcup_{k=1}^{\infty} \bigcup_{j=1}^{\infty} E_{j,k} = \bigcup_{k=1}^{\infty} I_k = X$. Rearrange the order of $E_{j,k}$'s. \square

23 $\text{Supp } F_1, F_2$ are disj closed subsets of \mathbf{R} suth $U = F_1 \cup F_2$ is interval. Prove F_1 or F_2 open.

SOLUS: If U open, then $F_1 = \emptyset, F_2 = \emptyset$ or \mathbf{R} . Now supp U not open $\Rightarrow F_1$ or F_2 not open.

We show F_1 open $\Leftrightarrow F_2$ not open. Note that F_1 open $\Leftrightarrow F_1 = \emptyset$. Simlr for F_2 .

WLOG, asum F_1, F_2 both not open, and $x \in F_1, y \in F_2$ with $x < y \Rightarrow x, y \in U \supseteq [x, y]$.

NOTICE that $T = [x, y] \cap F_1$ is a closed subset that has infly many elem. $\forall \sup T < y$.

(I) If $\sup T \notin F_1$. Then \exists a convg seq in T with $\lim \sup T$.

(II) Othws, $\forall t \in (\sup T, y], t \notin F_1 \Leftrightarrow t \in F_2$. Now \exists a convg seq in F_2 with $\lim \sup T \notin F_2$.

Ctradic the asum \Rightarrow at least one of F_1, F_2 is empty. \square

25 Give an exa of inv $f : \mathbf{R} \rightarrow \mathbf{R} \setminus \mathbf{Q}$.

SOLUS: Consider a seq disti $a_1, b_1, a_2, b_2, \dots \in \mathbf{R}$ where $\{a_1, a_2, \dots\} \in \mathbf{Q}$ and each $b_i \in \mathbf{R} \setminus \mathbf{Q}$.

Define $\varphi(a_j) = b_{2j-1}, \varphi(b_k) = b_{2k} \Rightarrow \varphi^{-1}(b_i) = \begin{cases} a_{(i+1)/2}, & \text{if } i \text{ is odd,} \\ b_{i/2}, & \text{if } i \text{ is even.} \end{cases}$

Let $B = \{b_1, b_2, \dots\}, U = \mathbf{Q} \cup B, K = \mathbf{R} \setminus U$. Extend $\varphi \in B^U$ to $\psi \in (K \cup B)^{K \cup U}$ by $\psi|_K = I$. \square

26 $\text{Supp } E, G \subseteq \mathbf{R}^n$, and G is open. Prove $E + G = \{x + y : x \in E, y \in G\}$ is open.

SOLUS: Asum $E + G$ not open $\Leftrightarrow \mathbf{R}^n \setminus (E + G)$ not closed.

Then $\exists a = x + y \in E + G$ suth $\forall \delta > 0, \exists b \notin E + G$ suth $\|a - b\|_\infty < \delta$.

Let $z = b - x \notin G \Rightarrow \|y - z\|_\infty < \delta \Rightarrow z \in B(y, \delta) \subseteq G, \exists \delta > 0$. \square

Or. $\exists a_1, a_2, \dots \notin E + G$ while its $\lim L = e + g \in E + G$. $\forall x \in E, a_k - x \notin G$

$\Rightarrow \lim_{k \rightarrow \infty} (a_k - e) = L - e = g \in G$. Thus $\mathbf{R}^n \setminus G$ not closed $\Leftrightarrow G$ not open. \square

0·E

1 Prove every convg seq in \mathbf{R}^n is bounded.

SOLUS: $\text{Supp } a_1, a_2, \dots \in \mathbf{R}^n$ suth $\forall \varepsilon > 0, \exists m \in \mathbf{N}^+, \forall k \geq m, |\|a_k\|_\infty - \|L\|_\infty| \leq \|a_k - L\|_\infty < \varepsilon$.

Thus $\|a_k\|_\infty \in (\lvert\varepsilon - \|L\|_\infty\rvert, \varepsilon + \|L\|_\infty)$. Now asum $\sup\{\|a_k\|_\infty : k \in \mathbf{N}^+\} = \infty$.

Which means $\forall t \in \mathbf{R}^+, \forall m \in \mathbf{N}^+, \exists k \geq m, \max\{\|a_1\|_\infty, \dots, \|a_m\|_\infty\} \leq \|a_k\|_\infty > t$. Ctradic. \square

• **TIPS 1:** By def, a seq $a_1, a_2, \dots \in \mathbf{R}^n$ convg to $L \Rightarrow$ every subseq convg to L .

3 $\text{Supp } F \subseteq \mathbf{R}^n$, every seq in F has a convg subseq with lim in F . Prove F is closed bounded.

SOLUS: $\text{Supp } a_1, a_2, \dots \in F$ convg with lim L . Becs \exists subseq with lim in F . By TIPS (1), $L \in F$.

Asum $\sup\{\|a\|_\infty : a \in F\} = \infty \Rightarrow \forall \Delta > 0, \exists a_1, a_2, \dots \in F$ with each $\|a_{k+1}\|_\infty \geq \|a_k\|_\infty + \Delta$.

Thus every subseq is unbounded \Rightarrow not convg. Ctradic. \square

• $\text{Supp } b \in A \subseteq \mathbf{R}^m, f : A \rightarrow \mathbf{R}^n$. Prove

[P] f is continu at $b \iff \forall b_1, b_2, \dots \in A$ suth $\lim_{k \rightarrow \infty} b_k = b, \lim_{k \rightarrow \infty} f(b_k) = f(b)$. [Q]

SOLUS: $Q \Rightarrow P$: $\text{Supp } \varepsilon > 0$ suth $\forall \delta > 0, \exists a \in A$ with $\|a - b\|_\infty < \delta$ and $\|f(a) - f(b)\|_\infty \geq \varepsilon$.

Fix a δ . Define $\delta_k = \delta/k \Rightarrow \exists a_k$ for each. Now $\lim_{k \rightarrow \infty} a_k = b$.

Thus $\forall m, \forall k \geq m, \|f(a_k) - f(b)\|_\infty \geq \varepsilon$. Ctradic Q.

$P \Rightarrow Q$: $\text{Supp } b_1, b_2, \dots \in A$ suth $\forall \delta > 0, \exists m, \forall k \geq m, \|b_k - b\|_\infty < \delta$.

Asum $\varepsilon > 0$ suth $\forall m, \forall k \geq m, \|f(b_k) - f(b)\|_\infty \geq \varepsilon$. Ctradic P. \square

SOLUS:

10 $\text{Supp bounded } A \subseteq \mathbf{R}^m$ and uniformly continu $f \in \mathbf{R}^A$. Prove f is bounded.

SOLUS: Asum $\forall a \in A, \exists b \in A, f(b) > f(a)$. Let .

11 $\text{Supp } f \in \mathbf{R}^{\mathbf{R}}$ is diff and f' is bounded. Prove f is uniformly continu.

SOLUS:

SOLUS:

18 $\text{Supp } h : \mathbf{R}^m \rightarrow \mathbf{R}^n$. Prove h continu $\iff h^{-1}(G)$ is open for all open $G \subseteq \mathbf{R}^n$.

SOLUS: $\text{Supp } h$ continu and open $G \subseteq \mathbf{R}^n$. We show $\mathbf{R}^m \setminus h^{-1}(G) = \{t \in \mathbf{R}^m : h(t) \notin G\}$ is closed.

Let $t_1, t_2, \dots \in \mathbf{R}^m \setminus h^{-1}(G)$ convg to $L \Rightarrow h(t_1), h(t_2), \dots \in \mathbf{R}^n \setminus G$ convg to $h(L)$.

Supp open $G \subseteq \mathbf{R}^n$ suth $\mathbf{R}^m \setminus h^{-1}(G)$ not closed. Asum show h continu.

$\exists t_1, t_2, \dots \in \mathbf{R}^m \setminus h^{-1}(G)$ convg to $L \in h^{-1}(G) \Rightarrow h(t_1), h(t_2), \dots \in \mathbf{R}^n \setminus G$ convg to $h(L) \notin G$. \square

22 $\text{Supp } \mathbf{R}^n \supseteq F_1 \supseteq F_2 \supseteq \dots$ is a decre seq of non- \emptyset subsets. Prove $\bigcap_{k=1}^{\infty} F_k \neq \emptyset$.

SOLUS:

23 *Supp closed $F \subseteq \mathbf{R}$, continu $g \in \mathbf{R}^F$. Prove \exists continu $h \in \mathbf{R}^{\mathbf{R}}$ suth $\forall x \in F, g(x) = h(x)$.*

SOLUS:

26 *Supp $F \subseteq \mathbf{R}^n$ suth every continu $f \in \mathbf{R}^F$ attains a max. Prove F is closed bounded.*

SOLUS:

27 *Supp $f \in \mathbf{R}^{\mathbf{R}}$ is incre. Prove \exists countable $A \subseteq \mathbf{R}$ suth $f|_{\mathbf{R} \setminus A}$ continu.*

SOLUS:

29 *Supp continu $f : [a, b] \rightarrow \mathbf{R}$, and t is between $f(a), f(b)$. Prove $\exists c \in [a, b], f(c) = t$.*

SOLUS:

33 *Supp $a_1, a_2, \dots \in \mathbf{R}^n$ is Cauchy seq and \exists subseq convg to L . Prove the seq convg to L .*

SOLUS: Supp subseq a_{j_1}, a_{j_2}, \dots convg to L . Then $\forall \varepsilon > 0, \exists j_m, \forall j_k \in \{j_m, j_{m+1}, \dots\}, \|a_{j_k} - L\| < \varepsilon$, and $\exists n \in \mathbf{N}^+, \forall i \geq n, \|a_i - L\| = \|(a_i - a_{j_k}) + (a_{j_k} - L)\| \leq \|a_i - a_{j_k}\| + \|a_{j_k} - L\| < 2\varepsilon$. \square

34 *Supp closed $F_1 \subseteq \mathbf{R}^n$ and closed bounded $F_2 \subseteq \mathbf{R}^n$. Prove $F_1 + F_2$ is closed.*

SOLUS: Asum \exists convg $a_1, a_2, \dots \in F_1 + F_2$ with $\lim a_k = L \notin F_1 + F_2$. Let each $a_k = x_k + y_k$, and $z_k = L - x_k$. $\forall \varepsilon > 0, \exists m \in \mathbf{N}^+, \forall k \geq m, \|a_k - L\| = \|x_k + y_k - L\| = \|y_k - z_k\| < \varepsilon$.

Supp subseq y_{j_1}, y_{j_2}, \dots convg to $L_y \in F_2$. Then $\forall \varepsilon > 0, \exists j_m, \forall j_k \in \{j_m, j_{m+1}, \dots\}, \|z_{j_k} - L_y\| = \|(z_{j_k} - y_{j_k}) + (y_{j_k} - L_y)\| < \varepsilon$. Now $x_{j_1}, x_{j_2}, \dots \in F_1$ convg to $L - L_y \notin F_1$. \square

ENDED
